

**TrustWeaver enriches e-auditability portfolio with archiving and invoice content services**

*Stockholm, 2 July 2010*

TrustWeaver today announced the introduction of two new services that are tightly integrated into its unique Compliance Map matrix, which already helps many trading communities maintain regulatory compliance in 39 countries using the highest standards of electronic evidence. TrustWeaver's On Demand digital certainty services are embedded into the Cloud and software solutions of many of the world's leading B2B integration vendors.

The first new service is an on demand e-archive for invoices and other legally critical documents. The archive service will automatically apply the required storage time of applicable VAT laws and a legal entity's country of establishment accounting requirements. Building on TrustWeaver's existing audit tools integrated with powerful archive search functions, the integrity and authenticity of stored documents can be verified either through revalidating of a (TrustWeaver or third party) digital signature or through a combination of associated contract and/or transaction data. Going forward, companies will also be able to upload and associate third party audit data or e-invoicing trust marks so as to bolster their evidence position. Just like with the existing electronic signature and time-stamping service, the Compliance Map configures the TrustWeaver On Demand rules engine and serve as a platform for tax audit information concerning applicable rules for transactions in any combination of supported jurisdictions.

With the second new service, TrustWeaver will enable international companies and their exchange platform providers to easily implement the controls needed for meeting regulatory requirements for the mandatory content of invoices. This service solves a similar regulatory complexity problem as the other TrustWeaver services, including an in-built compliance maintenance guarantee so that companies do not have to monitor legislative evolution across all their markets.

TrustWeaver On Demand supports many different types of documents, document formats, signature formats and business processes. Integration with the new functionality runs through the same simple but highly secure web services interface as pre-existing TrustWeaver services.
